

**ENV Report 47 – *User’s Manual for SEDLOAD – Sediment Loading of Backwaters and Secondary Channels*** by Clay LaHatte and Stephen Maynard.

**ABSTRACT**

The SEDLOAD package is a group of programs designed to determine the sediment load delivered to the inlets of backwaters and secondary channels of a river due to river traffic, specifically tow traffic. This user’s manual describes how to set up batch files to run the program, input and output file formats, example outputs, and source code listings.
